Exploring the World of Biology: From Mushrooms to Complex Life Forms (Exploring Series) John Hudson Tiner

The field of biology focuses on living things, from the smallest microscopic protozoa to the largest mammal. In this book you will read and explore the life of plants, insects, spiders and other arachnids, life in water, reptiles, birds, and mammals, highlighting God's amazing creation. You will learn about the following and so much more:

- How does biological classification give each different type of plant or animal a unique name?
- In what ways are seeds spread around the world?
- What food does the body use for long-term storage of energy?
- How did biologists learn how the stomach digested food?
- What plant gave George de Mestral the idea for Velcro?

For most of history, biologists used the visible appearance of plants or animals to classify them. They grouped plants or animals with similar-looking features into families. Starting in the 1990s, biologists have extracted DNA and RNA from cells as a guide to how plants or animals should be grouped. Like visual structures, these reveal the underlying design or creation.

The newest book in our Exploring series, *Exploring the World of Biology* is a fascinating look at life - from the smallest proteins and spores, to the complex life systems of humans and animals.
