Essay from the year 2008 in the subject Nutritional Science, grade: 65 Punkte = 2,3, The University of Liverpool (School of Archaeology, Classics and Egyptology), course: Diet, Evolution and Culture, 26 entries in the bibliography, language: English, comment: Das englische Bewertungssystem ist nach Punkten aufgeteilt, wobei 100 Punkte den höchsten Wert darstellen. Die erreichte Punktzahl des Essays beträgt 65. Dies entspricht einer Bewertung von 2,3 nach dem deutschen Benotungssystem an Universitäten. , abstract: Hominid evolution has been a widely discussed aspect concerning its effects on ecological, physiological, and behavioral as well as reproductive, and metabolic development of humans and non-human primates for plenty of years. During the last decade, a huge amount of investigations regarding large brain size in humans have tried to figure out whether the observation, that humans have a relatively larger brain size than other primates or non-primate mammals, is based on either the correlated decrease of other tissues or significant foraging strategies , or even both. Although it is common, that an enlargement of the brain - being a high expensive metabolic organ - has to lead in dietary changes or that it was influenced by nutritional variations during the evolution of humans and non-human primates , there are different possibilities to explain this evolutionary progress. In 1995, Aiello/Wheeler published their expensive-tissue hypothesis regarding the relationship between large brain sizes in humans and high-quality diets. The authors attempt to confirm the parallel between the increase of hominid brains, the obviously correlated decrease of the gastrointestinal tract and dietary changes based on animal protein. They constitute the large brain sizes in human and non-human primates and its connection to nutritional varies to be one of the most significant prime releasers of brain evolution. The submitted essay portrays the main arguments of Aiello/Wheel
